                    Sialyltransferase catalyses the addition of sialic acids to carbohydrate groups which are present on glycoproteins and glycolipids or to sugar chains to produce carbohydrates which function as determinants in blological recognition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                239

Site-directed mutagenesis eliminated the internal EcoRI site using a primer which binds to nucleotides 295-311 of the sequence encoding this protein. An A to G transition abolished the EcoRI recognition site, GGAATTC, but preserved the native amino acid coding sequence (amino acid 41). The altered sequence was used in a expression vector for the transfection of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Expression of recombinant glycoproteins such as erythropoeitin, where the natural mixt. of sialic acid linkages differs from that of the recombinant glycoprotein produced in CHO cells, is possible.
                                                                                                                                                                                                                                                                                  /note= "peptide sequence overlap, including NH2-terminal sequence of the purified sialyltransferase"
Beta-galactoside alpha 2,6 sialyltransferase; recognition site; site-directed mutagenesis; expression vector; erythropoietin; sialic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide
```

```
The present invention relates to an isolated nucleic acid comprising a nucleotide sequence coding for a full-length mammalian CM3 synthase or their biologically active polypeptide fragment. It is also useful as a size marker in nucleic acid or protein electrophoresis or chromatography and for detecting expression of sialyltransferase (ST) in whole organs, tissue or cells. The nucleic acid probes can also be used to detect, quantitate or isolate a mammalian sialyltransferase nucleic acid in a test sample or to identify sialyltransferase homologues, as oligonucleotide probe e.g. in polymerase chain reaction differential display, in combination with cDNA libraries, expression libraries, etc. The nucleic acid can be modified to make it resistant to cellular enzymes, oxidation, reduction, nucleasses, etc. Or to enhance its uptake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; sialyltransferase; GM3-synthase-specific immunogenic activity; 4ST3GalIIH domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  496
 The present invention relates to an isolated nucleic acid comprising a nucleotide sequence coding for a full-leometh mammalian GM3 synthase or their biologically active polypeptide fragment. It is also useful as a size marker in nucleic acid or protein electrophoresis or chromatography
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse; stalyltransferase; GM3-synthase-specific immunogenic activity;
4ST3 Gal VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated nucleic acid useful for coding a full-length mammalian GM3 synthase or its biologically active polypeptide fragment, useful for detecting expression of sialyltransferase in whole organs, tissue or

and for detecting expression of stalyltransferase (ST) in whole organs, tissue or cells. The nucleic acid probes can also be used to detect, quantitate or isolate a mammalian stalyltransferase nucleic acid in a test sample or to identify sallyltransferase homologues, as oligonucleotide probe e.g. in polymerase chain reaction differential display, in combination with CDNA libraries, expression libraries, etc. The nucleic acid can be modified to make it resistant to cellular enzymes, oxidation, reduction, nucleases, etc. Or to enhance its uptake into cells. The present sequence is mouse sialyltransferase, 4873 Gal VI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             363

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, and polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-embl/AA2001.DAT:ABG18000

The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human hote: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      246

```

```
The present invention relates to an isolated nucleic acid comprising a their biologically active polypeptide fragment. It is also useful as assize marker in nucleic acid or protein electrophoresis or chromatography and for detecting expression of sialyltransferase (ST) in whole organs, tissue or cells. The nucleic acid probes can also be used to detect, quantitate or isolate a mammallan sialyltransferase nucleic acid in a lollgonucleotide probe e.g. in polymerase chain reaction differential display, in combination with CDNA libraries, expression libraries, etc. The nucleic acid can be modified to make it resistant to cellular the nucleic acid can be modified to make it resistant to cellular engrymes, oxidation, reduction, nucleases, etc. Or to enhance its uptake into cells. The present sequence is mouse 4873GalIIM domain of
                                                                                                                                                                 Mouse; sialyltransferase; GM3-synthase-specific immunogenic activity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated nucleic acid useful for coding a full-length mammalian GM3 synthase or its biologically active polypeptide fragment, useful for detecting expression of sialyltransferase in whole organs, tissue or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         493

```
The present invention relates to an isolated nucleic acid comprising a nucleotide sequence coding for a full-length mammalian GM3 synthase or their biologically active polypeptide fragment. It is also useful as a size marker in nucleic acid or protein electrophoresis or chromatography and for detecting expression of slalyltransferase (ST) in whole organs, tissue or cells. The nucleic acid probes can also be used to detect, quantitate or isolate a mammalian slalyltransferase nucleic acid in a test sample or to identify slalyltransferase homologues, as coligonuclectide probe e.g. in polymerase chain reaction differential display, in combination with cDNA libraries, expression libraries, etc. The nucleic acid can be modified to make it resistant to cellular corymes, oxidation, reduction, nucleases, etc. Or to enhance its uptake into cells. The present sequence is rat 4ST3GalIIR domain of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              synthase or its biologically active polypeptide fragment, useful for detecting expression of sialyltransferase in whole organs, tissue or cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid useful for coding a full-length mammalian GM3
                                                                                                                                                                                                                                                                                                                     Rat; sialyltransferase; GM3-synthase-specific immunogenic activity; 48T3GalIIR domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the human alpha2-6 sialate transferase. The invention relates to a method for the preparation of sialate transferase. In the method, E. coll stransformed with an expression vector containing a stalate transferase gene and a maltose-combined protein gene, the transformant is cultured to form sialate transferase, and sialate transferase is collected from the culture. The method can express sialate transferase as an active soluble protein and can prepare slalate transferase easily and efficiently in a large amount.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA1999.DAT:AAY39959

                                                                                                                                                                                                This sequence represents a sialyltransferase enzyme from HeLA cells. (EC 24.99.1). It was decoded from the appropriate cDNA. the method of the invention is used to produce membrane-bound mammalian glycosyltransferase and variants, using transformed yeasts. It is less time consuming than natural source isolation and chemical methods.
                                                                                                                                                                                                                                                                                                                                               cells with expression cassettes contg. mammalian coding sequences controlled by yeast promoters

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cDNA encoding sialyltransferase (ST) was isolated from HepG2 cells, cloned by PCR using the primers given in AAQ66901-02, and expressed in Escherichia coll DH5-alpha using plasmid pSIA2. Hybrid proteins (AAR55708, AAR55709) comprising membrane-bound or soluble derivatives of galactosyltransferase linked to soluble ST were prepared in Saccharomyces cerevisiae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Proteins with glycosyl transferase activity - useful for synthesis or modification of glyco-proteins, glyco-lipid(s) and oligosaccharide(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Galactosyltransferase; sialyltransferase; hybrid protein; glycosyltransferase; glycosprotein; glycolipid; oligosaccharide; HepG3; Escherichia coli; pSIA2; glycosylation; saccharomyces cerevitaie.

```
The DNA sequence is expressed in eukaryotic cells (e.g. 3MK1-3-B11 cells), resulting in slalylation of the glycoprotein. The process may be used to produce slalylated recombinant forms of glycoproteins such as antithrombin III, erythropoietin, factor VII, factor VIIIc, factor IX, tissue factor, interleukin receptors, TNF receptor of CD4, or slalylated monoclonal antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA1992.DAT:AAR28839

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           is.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are closated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases such as viral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal such the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.Wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases
                                                                                                                                                                                                                                                                                                                                                                                                   Claim 11; SEQ ID NO 6482; 1701pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GATGTCGGCCGCATGACCATGATTCGAGTTGTGTCCCATACCAGCGTTCC 566

```
The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  398 ACCTTTGTGCCATAGTGTCAAACTCAGGTCAGATGGTTGGCCAGAAGGTG 447

The polynucleotide sequences given in AAA39052 to AAA39088 encode the human secreted proteins given in AAB08891 to AAB08984. The human secreted proteins given in AAB08891 to AAB08984. The human secreted proteins can have activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic; anti-proliferative; immunosuppressive; antibacterial; and vulnerary. The secreted proteins and their related polynucleotide sequences are useful for diagnostic and therapeutic methods useful for diagnosting and treating disorders related to the secreted proteins. The proteins, and comply the secreted proteins of the proteins, and comply the secreted proteins of the proteins of the proteins of disorders, infectious disease, regeneration of tissues, for chemotaxis and for screening molecules that the proteins of polynucleotide sequences may be used as food additives or preservatives, to increase or decrease storage capabilities, fat content, liptd, protein, carbohydrate, vitamins, minerals, co-factors or other nutritional components. Agonists or antagonists of the proteins may be used to prevent scar tissue growth during wound healing, and hyper-vascular diseases. AAA39031 to AAA39051

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an Oligo-dr primer and an Oligonucleotide comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 5'-end sequence, where the complementary strand of a polynucleotide of the sequence, where the complementary to a polynucleotide comprises a 3'-end sequence, where the complementary to a polynucleotide comprises at least 15 nucleotides and the combination of the 5pecification. The primer sets can be useful for synthesising polynucleotides, in gene therapy. The primers are useful for synthesising polynucleotides, battlearly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. AAH13629 to AAH13629 to AAH13632 to AAH3632 to AAH3632 to AAH3632 to AAH3632 to AAH3632 to AAH3642 the proteins allow a prepared in the exemplification of the proteins and a prepared of the proteins and a prepared of the proteins and a protein a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of detect the presence of a tumour in a mammal by comparing the level of and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, ung, colon, creast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -

                                                                                                                                                                                           188
                                                                       648
                                                                                                                                                                                                                                                                                                                         AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to creat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, camecar diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note: The sequence data for this patent did not form part of the printed

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system incropathies and central nervous system diseases, such as Alzheimer's parkinson's disease. Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and strining activity, chemotactic/chemokinetic activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed

```
AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatoriopic; vulnerary;
sequences that attiparkinsonian; nootropic; neuroprotective;
osteopathic; anticonvulsant; antiarthritic; immunosuppressant;
immunostimulant; cardiant; thrombolytic; coaqulant; vasotropic;
antidiabetic; hypotensive; dermaclogical; immunosuppressaive;
antidiabetic; hypotensive; dermaclogenerative and section hypotensive; osteoarthritis,
bacterial or fungal infection, malaria, autoimmune disorders, asthma,
allergies, aplastic anaemia, burns; wounds, bone and cartilage damage,
nocturnal haemoglobinuia, antidiaminosis; and as a contraceptive.
cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autocimmune disorder; asthma; allergy; aplastic anaemia; nocturnal haemoglobinuria; burn; wound; bone damage; cartilage damage; antiinflammatory disease; coagulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acids and peptides derived from open reading frame \mathbf{x}, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         126 CGCGCCGCTGCTCGGTGGCAG......GAGGGCCGGCGGAGCGCCA 166

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as lateral nervous system diseases, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as immune system suppression, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed

```
nucleotide sequence coding for a full-length mammalian GM3 synthase or size marker in nucleic sequence coding for a full-length mammalian GM3 synthase or size marker in nucleic acid or protein electrophoresis or chromatography and for detecting expression of sialyltransferase (ST) in whole organs, tissue or cells. The nucleic acid probes can also be used to detect, and test sample or to identify sialyltransferase homologues, as oligonucleotide probe e.g. in polymerase chain reaction differential display, in combination with cDNA libraries, expression libraries, etc. The nucleic acid can be modified to make it resistant to cellular enzymes, oxidation, reduction, nucleases, etc. Or to enhance its uptake into cells. The present sequence is human sialyltransferase, 7576 Gal V
                                                                                                                                                                    present invention relates to an isolated nucleic acid comprising
Isolated nucleic acid useful for coding a full-length mammalian GM3 synthase or its biologically active polypeptide fragment, useful for detecting expression of sialyltransferase in whole organs, tissue or
                                                                                                                           6A-6B; 81pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                         524
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               691
```

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as hizheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/Linhibin activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

ucleic acids and polypeptides, useful for treating disorders central nervous system injuries -

nucleic acids and

such as Novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                703
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the polynucleotide sequence given in AAA78381 to AAA78432 encode the human secreted proteins given in AAB24437 to AAB24604. Human secreted proteins given in AAB24437 to AAB24604. Human secreted proteins have activitites based on the tissues and cells the genes are expressed in Examples of activities include: cytostatic; antianaemic; antidiabetic; antinflammatory; ophthalmological; antirheumatic; antidiathritic, antiposoriatic; antimicrobial and antiparkinsonian.

Contropic; neuroprotective; antimicrobial and antiparkinsonian.

Human secreted protein polynucleotides, polypeptides, antagonists and/or agonists may be useful in treating, preventing, and/or diagnosing other discases, and/or conditions such as: (a) acncers; (b) discases of the immune system; (c) angiogenesis disorders; (d) diseases hyperproliferative disorders; (e) cardiovascular disorders; (f) diseases associated with increase apoptosis; (g) neurological diseases; and (h) infectious diseases. They are also used to promote wound healing.

AAA78372 to AAA78380 and AAB24436 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ļ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ty seven human nucleic acids encoding secreted proteins, useful ir treatment, prevention and diagnosis of cancers, disorders of the une system, anglogenesis disorders, neurological diseases and
antipsoriatic; antiangiogenic; cardiant; anti-HIV; nootropic; neuroprotective; antimicrobial; antiparkinsonian; cancer; immune system disorder; anglogenesis; hyperproliferative disorder; cardiovascular disorder; apoptosis; neurological disease; infectious disease; wound healing; chromosome 9.

The protein and nucleic acids may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate protein expression.

```
The present invention relates to human proteins (AAB61608-AAB61617) and the present invention have hydropholic domains and can be used for the treatment of arrious immune deficiencies and disorders, such as severe combined immunodeficiency (SCID), multiple sclerosis, rheumatoid arthritis, autoimmune pulmonary inflammation, graft versus-host disease and cullain-Barre syndrome. The proteins may also be useful in the treatment of allergic reactions and conditions, such as asthma and in regulation of namemorpolesis or lymphold cell deficiencies. The proteins may also have utility in compositions used for bone, cartilage, tendon and/or nerve tissue growth or regeneration as well as wound healing and in the periodontal disease and in other toother repair processes. Other uses include treatment of thrombolytic and haemostatic conditions, treatment of concernation of tunomurs and inhibiting infection by bacteria, viruses,
                                                                                                                                                                                                                                                                                                               New human proteins with hydrophobic domains, useful for the treatment of immune disorders, tumors, allergic conditions, thrombosis and microbial infection -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        318 CIACACATACA........GGCGGCCCCTTCGAACTCACTATGGAT 355

This sequence represents a human secreted protein amino acid sequence.
The invention relates to sequences AAA87725-A8774 which encode human secreted proteins AAB25763-B25812. The proteins include signal peptides.
Included in the invention are a host cell containing one of the cDNA sequences, and a purified antibody capable of binding to one of the sequences, and a purified antibody capable of binding to one of the sequences, and a purified antibody capable of binding to one of the secreted proteins. Also contained in the invention are methods for identifying features of the cDNA sequences using a computer programme. The cDNAs are useful for expressing secreted proteins or fragments to obtain antibodies capable of specifically binding to the secreted proteins. The cDNAs may also be useful in diagnostic, forensic, gene therapy and chromosome mapping procedures and may be used to design expression vectors and secretion vectors. The proteins of the invention may be used to treat diseases including cancer, autoimmune diseases, cardiovascular disorders, cystic fibrosis, hypothyroidism, immunological disorders, amyloidosis, brain disorders, skeletal muscle disorders, eye disorders, analyloidosis, brain disorders, sibeletal muscle disorders, eventual dementia, hyperlipidaemia, septic shock and impotence.
                                                                                                                                                     chromosome mapping; cancer; autoimmune disease; cardiovascular disorder; cystic fibrosis; hypothyroidism; immunological disorder; amyloidosis; brain disorder; skeletal muscle disorder; eye disorder; obesity; mitochondriocytopathy; diabetes; atherosclerosis; Alzheimer's disease; neurodegenerative disorder; graft rejection; dementia; hyperlipidaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polynucleotides and polypeptides encoding proteins with signal peptides, useful in diagnostic, forensic, gene therapy and chromosome
                                                                                                                                  Human; secreted protein; forensic procedure; gene therapy;

The present sequence is a human carbohydrate-modifying enzyme (CME). CME polynucleotides and polypeptides are useful for treating and diagnosing diseases associated with CME such as diabetes.

autoimmune/inflammatory disorders such as AIDS, Addison's disease, adult respiratory distress syndrome, allergies, anaemia, asthma, atherosclerosis, autoimmune thyroiditis, bronchitis, cholocystitis, contact dermatitis, Good pasture's syndrome, gout, Grave's disease, glomerulonephritis, Good pasture's syndrome, gout, Grave's disease, Hashimoto's thyroiditis multiple sclerosis, myasthenia gravis, osteogronosis, pancreattitis, polymyositis, psoriasis, osteograthitis, scleroderma, sjogren's syndrome, systemic lupus erythematosus, ulcerative colitis, uveitis, Werner syndrome, complications of cancer, haemodialysis, and extracorporeal circulation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel carbohydrate modifying enzyme polypeptides and polynucleotides for diagnosis, treatment, and prevention of carbohydrate metabolism disorders, autoimmune/inflammatory disorders, and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunosuppressive; anti-HIV; antiinflammatory; antianaemic; antiathmatic; antiarteriosclerotic; antiarteriosclerotic; antiarteriosclerotic; antiarteriosclerotic; antipyrold; hepatotropic; antiarthritic; antipsoriatic; uropathic; ophthalmological; dermatological; antiulcer; cytostatic; virucide; antibacterial; thugtcide; protozoacide; tranquiliser; vulnerary; diabetes; autolmmune disorder; inflammatory disorder; inflammatory disorder; infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        526
                                  326
                                                                                                                                         376
                                                                                                                                                                                                                                                  426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of anisorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. ALDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. athma), cardiovascular disorders (e.g. athma), cardiovascular disorders (e.g. atherosolerosis), blood-related disorders (e.g. themophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                     preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous
                                                                                                                                                                                                                                                                                                                                                                                        Novel polypeptides and polynucleotides useful for diagnosing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               225
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        276 AAACTGCTTTGGACAACCTGGTACAAAGTGGATACCATTCTCCTACACAT 325

```

```
The polynucleotide sequence given in AAA78381 to AAA78432 encode the human secreted proteins given in AAB24437 to AAB24604. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic; antianaemic; antidiabetic; antiinflammatory; ophthalmological; antirheumatic; antiarthritic; antisportatic; antiangiogenic; cardiant; anti-HIV; nootropic; neuroprotective; antimicrobial and antiparkinsonian. Human secreted protein polynucleotides, polypeptides, antagonists and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Forty seven human nucleic acids encoding secreted proteins, useful in the treatment, prevention and diagnosis of cancers, disorders of the immune system, angiogenesis disorders, neurological diseases and hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                      seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA2000.DAT:AAB24495

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is human drug metabolising enzyme (DME-17) protein. Human DME and its nucleic acid molecule are useful for the diagnosis, treatment and prevention of disorders associated with increased or decreased expression of DME. Examples of such disorders include, autoimmune/inflammatory disorder such as acquired immune deficiency syndrome (AIDS), rheumatoid arthritis, osteoporosis; cell proliferative disorder such as actinic Keratosis, atheroscierosis; developmental disorder such as epilepsy, anemnia; endocrine disorder such as acromegaly, cretinism, thyrotoxicosis; pancreatic disorder such as acromegaly, cretinism, thyrotoxicosis; pancreatic disorder such as metabolic disorder such as Addison's disease, obesity; gastrointestinal disorder such as anorexia, dysphagia and hepatic tumours including nodular hyperplasia, adenomas and carcinomas. DME DNA is useful for
                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; autoimmune disorder; inflammatory disorder; atherosclerosis; so steeporosis; eye disorder; hepatic tumour; Addison's disease; cretinism; rheumatoid arthritis; acquired immune deficiency syndrome; AIDS; anaemia; developmental disorder; endocrine disorder; infitis; acromegaly; epilepsy; thyrotoxicosis; pancreatic disorder; diabetes mellitus; obesity; adenoma; astrointestinal disorder; nodular hyperplasia; conjunctivitis; glaucoma; actinic keratosis; metabolic disorder; dysphagia; anorexia; carcinoma; cell proliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "Mature drug metabolising enzyme (DME-17) protein"

and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contected with it. A specific polypeptide can be used to stimulate the proliferation of differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -Claim 11; Fig 536; 774pp; English.
